The following experimental techniques were used to determine the structure:

SOLUTION NMR

The overall completeness of chemical shifts assignment was not calculated.

Percentile scores (ranging between 0-100) for global validation metrics of the entry are shown in the following graphic. The table shows the number of entries on which the scores are based.

Metric	Whole archive (#Entries)	NMR archive (#Entries)
Clashscore	125131	11601

The table below summarises the geometric issues observed across the polymeric chains and their fit to the experimental data. The red, orange, yellow and green segments indicate the fraction of residues that contain outliers for ≥ 3 , 2, 1 and 0 types of geometric quality criteria. A cyan segment indicates the fraction of residues that are not part of the well-defined cores, and a grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions $\leq 5\%$

- The chemical structure of CRH (Catecholamine Receptor Homolog) is a complex polycyclic molecule. It features a central benzene ring (C9-C14) substituted with three hydroxyl groups (O1, O9, O8) at positions C1, C9, and C8, respectively. This central ring is fused to two other rings: a six-membered ring (C1-C4) and a five-membered ring (C4-C5-C6-C7-C8). The six-membered ring (C1-C4) has a hydroxyl group (O1) at C1 and is substituted with a side chain at C2. The side chain consists of a chiral center C1'(S) bonded to a methoxy group (C1M) and a hydroxyl group (O1'). This side chain is further substituted at C2' with a hydroxyl group (O2') and a chiral center C3'(S). The C3'(S) center is bonded to a hydroxyl group (O3') and a chiral center C4'(R). The C4'(R) center is bonded to a hydroxyl group (O4') and a methoxy group (C4M). The five-membered ring (C4-C5-C6-C7-C8) is substituted with a hydroxyl group (O8) at C8 and a methoxy group (C15) at C7. The structure is labeled with atom names (C1, C2, C3(R), C4, C5, C6, C7, C8, C9, C10, C11, C12, C13, C14, C15, C1M, C1', C2', C3'(S), C4'(R), O1, O2', O3', O4', O8, O9) and stereochemistry (R, S, wedge, dash).

4 Residue-property plots [i](#)

4.1 Average score per residue in the NMR ensemble

These plots are provided for all protein, RNA and DNA chains in the entry. The first graphic is the same as shown in the summary in section 1 of this report. The second graphic shows the sequence where residues are colour-coded according to the number of geometric quality criteria for which they contain at least one outlier: green = 0, yellow = 1, orange = 2 and red = 3 or more. Stretches of 2 or more consecutive residues without any outliers are shown as green connectors. Residues which are classified as ill-defined in the NMR ensemble, are shown in cyan with an underline colour-coded according to the previous scheme. Residues which were present in the experimental sample, but not modelled in the final structure are shown in grey.

Bond lengths and bond angles in the following residue types are not validated in this section: DDA, MDA, MG, CRH, DDL

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with $|Z| > 5$ is considered an outlier worth inspection. RMSZ is the (average) root-mean-square of all Z scores of the bond lengths (or angles).
