The table below summarises the geometric issues observed across the polymeric chains and their fit to the electron density. The red, orange, yellow and green segments on the lower bar indicate the fraction of residues that contain outliers for ≥ 3 , 2, 1 and 0 types of geometric quality criteria. A grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions $\leq 5\%$. The upper red bar (where present) indicates the fraction of residues that have poor fit to the electron density. The numeric value is given above the bar.

- The image displays the chemical structure of S-Adenosylmethionine (SAM), a key molecule in biological methylation reactions. The structure is composed of several interconnected rings and functional groups, with atoms labeled for identification:
- Adenosine Part:** Consists of an adenine base (a fused pyrimidine and imidazole ring system) attached to a ribose sugar. The adenine base is labeled with N1, C2, N3, C4, C5, N6, C6, N7, and C8. The ribose sugar is labeled with O4', C2'(W), C3'(S), C5', and C2'(S).
 - Methionine Part:** A five-carbon chain starting from the ribose sugar at C5'. It includes a sulfur atom (S) and a terminal methyl group (C6). The methionine chain is labeled with C5', S, C6, C4(S), and C3.
 - Functional Groups:** The structure includes an amino group (NH₂) at N6 of the adenine base, a hydroxyl group (OH) at C2'(W) of the ribose, another hydroxyl group (OH) at C3'(S) of the ribose, and a carboxylic acid group (COOH) at the end of the methionine chain (C3).
 - Chirality:** The structure indicates stereochemistry at several chiral centers: C2'(W) and C3'(S) of the ribose are shown with dashed bonds, indicating they are pointing away from the viewer. C5' of the ribose is shown with a solid wedge bond, indicating it is pointing towards the viewer. C3 of the methionine chain is shown with a dashed bond, indicating it is pointing away from the viewer.

3 Residue-property plots [i](#)

These plots are drawn for all protein, RNA and DNA chains in the entry. The first graphic for a chain summarises the proportions of the various outlier classes displayed in the second graphic. The second graphic shows the sequence view annotated by issues in geometry and electron density. Residues are color-coded according to the number of geometric quality criteria for which they contain at least one outlier: green = 0, yellow = 1, orange = 2 and red = 3 or more. A red dot above a residue indicates a poor fit to the electron density ($RSRZ > 2$). Stretches of 2 or more consecutive residues without any outlier are shown as a green connector. Residues present in the sample, but not in the model, are shown in grey.

In the following table, the column labelled ‘#RSRZ > 2’ contains the number (and percentage) of RSRZ outliers, followed by percent RSRZ outliers for the chain as percentile scores relative to all X-ray entries and entries of similar resolution. The OWAB column contains the minimum, median, 95th percentile and maximum values of the occupancy-weighted average B-factor per residue. The column labelled ‘Q < 0.9’ lists the number of (and percentage) of residues with an average occupancy less than 0.9.

Mol	Chain	Analysed	<RSRZ>	#RSRZ>2	OWAB(Å ²)	Q<0.9

In the following table, the Atoms column lists the number of modelled atoms in the group and the number defined in the chemical component dictionary. LLDF column lists the quality of electron density of the group with respect to its neighbouring residues in protein, DNA or RNA chains. The B-factors column lists the minimum, median, 95th percentile and maximum values of B factors of atoms in the group. The column labelled 'Q< 0.9' lists the number of atoms with occupancy less than 0.9.
